

Test Plan – Student Enrollment Management System

Document Date: 2026-01-07

Owner: Annapurna Matlapudi

Version: 1.0

1. Introduction

This test plan defines the approach for manual functional testing and backend data validation for a sample Student Enrollment Management System.

2. Scope

- In Scope: Student creation, course creation, enrollment workflows, status updates, SQL validation
- Out of Scope: Performance testing, security testing, full automation framework

3. Test Strategy

- Execute smoke tests for core navigation and basic flows
- Run functional test cases for students/courses/enrollments
- Use SQL queries to validate backend records and relationships
- Log defects with steps to reproduce and expected vs actual results

4. Test Environment

- Sample DB (MySQL/PostgreSQL/SQLite)
- Sample data for students, courses, and enrollments
- Tools: Excel for documentation, SQL client for queries

5. Entry / Exit Criteria

- Entry: Test environment available; build deployed; test data prepared
- Exit: All critical/high defects resolved or accepted; smoke and regression suites pass

6. Deliverables

- Test cases spreadsheet
- SQL validation query file
- Defect log
- Summary of execution results

7. Risks and Mitigations

- Risk: Unclear requirements → Mitigation: Document assumptions and confirm expected behavior
- Risk: Inconsistent test data → Mitigation: Use controlled sample dataset and reset between runs

8. Sign-off
